The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claim 1 is rejected under 35 U.S.C. 102(b) as being anticipated by Cornish et al. (U. S. Patent No. 5,464,985). Cornish et al. discloses a reflectron (3B, as shown in FIG. 9B) for use in a mass spectrometer comprising a plurality of reflectron electrodes (11B) connectable to one or more high voltage power supplies (lines 53-57 in column 9) wherein means (potentiometers 17) for changing the electrical potentials of at least some of said reflectron electrodes (11B) is provided in order to change the shape of the electrical field inside said reflectron.

Claims 2-6 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

The following is a statement of reasons for the indication of allowable subject matter: The prior art does not teach to provide a reflectron with at least two sets of field resistances that can be connected one set at a time, or in parallel, or in series, between the reflectron electrodes, or to mount a set of resistances on a movable rod that can place them into or out of electrical contact with reflectron electrodes. Compare Bertsch (U. S. Patent No. 6,849,846), which teaches that the precision of the placement of the components of a reflectron is critical, which would suggest difficulty in exchanging sets of field resistances.
